

## Data Collection and Preprocessing Phase

Date	15 July 2024
Team ID	team-739852
Project Title	Online Payments Fraud Detection
Maximum Marks	6 Marks

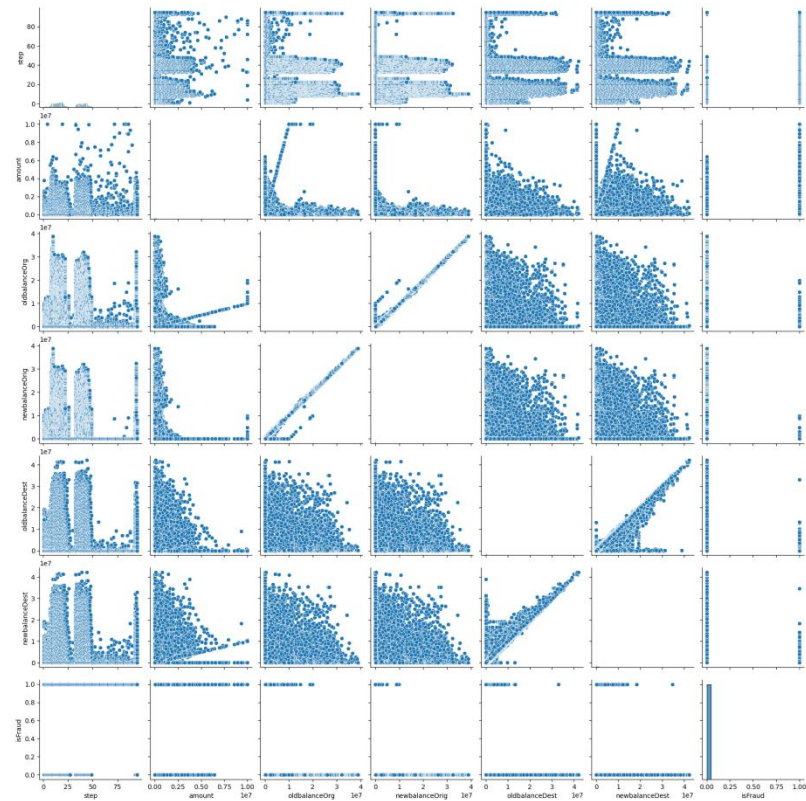

## Data Exploration and Preprocessing Report

Dataset variables will be statistically analyzed to identify patterns and outliers, with Python employed for preprocessing tasks like normalization and feature engineering. Data cleaning will address missing values and outliers, ensuring quality for subsequent analysis and modeling, and forming a strong foundation for insights and predictions.

Section	Description

## Handling Null Values

### Handling Null Values

```
[11]: df.isnull().sum()
[11]: step      0
     type      0
     amount    0
     oldbalanceOrig  0
     newbalanceOrig  0
     oldbalanceDest  0
     newbalanceDest  0
     isfraud      0
     dtype: int64

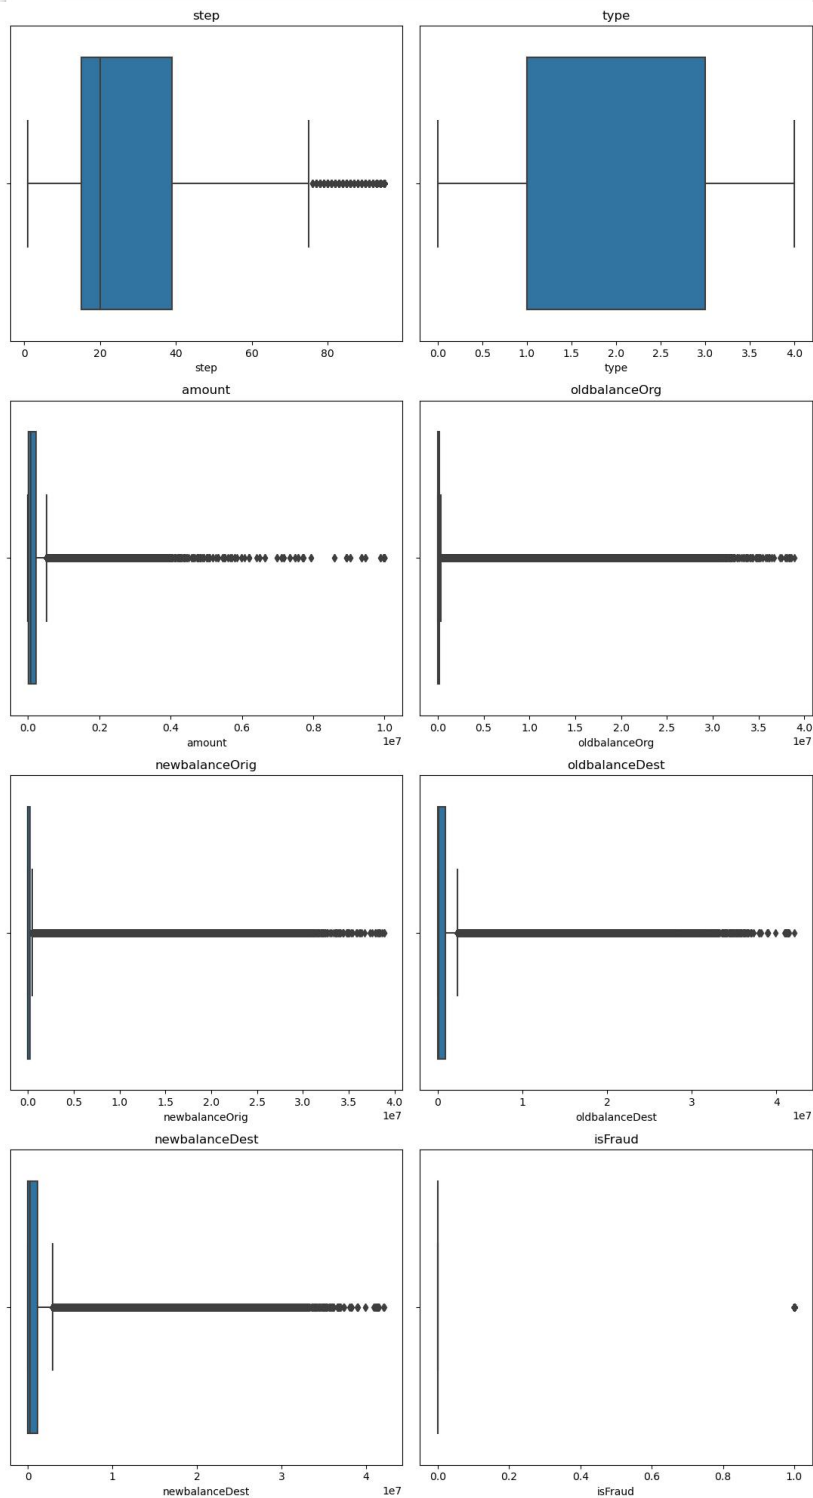

[12]: df.info()
Out[12]:
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1048575 entries, 0 to 1048574
Data columns (total 8 columns):
#   Column              Non-Null Count  Dtype
---  --
0   step                1048575 non-null  int64
1   type                1048575 non-null  object
2   amount              1048575 non-null  float64
3   oldbalanceOrig      1048575 non-null  float64
4   newbalanceOrig      1048575 non-null  float64
5   oldbalanceDest      1048575 non-null  float64
6   newbalanceDest      1048575 non-null  float64
7   isfraud             1048575 non-null  int64
dtypes: float64(5), int64(2), object(1)
memory usage: 64.0+ MB
```

## Viewing outliers

### Viewing Outliers

```
[16]: num_columns = df.shape[1]
      num_rows = (num_columns + 1) // 2

      plt.figure(figsize=(11, num_rows + 5))
      for i, column in enumerate(df.columns):
          plt.subplot(num_rows, 2, i + 1)
          sns.boxplot(x=df[column])
          plt.title(column)
      plt.tight_layout()
      plt.show()
```

## Handling outliers

### Handling Outliers

```
[17]: Q1 = df.quantile(0.25)
      Q3 = df.quantile(0.75)
      IQR = Q3 - Q1

      outliers = ((df < (Q1 - 1.5 * IQR)) | (df > (Q3 + 1.5 * IQR))).any(axis=1)
      print("Number of outliers:", outliers.sum())

      Number of outliers: 332172
```

## Saved Processed Data

```
[18]: df_cleaned = df[~outliers]
      print("Data shape after removing outliers:", df_cleaned.shape)

      Data shape after removing outliers: (716403, 8)

[19]: df.describe(include='all')
```
